TITLE: Effect of cations of alkaline and alkaline-earth metals on the physical electrotonus of the denuded nerve of a frog

SOURCE: Fiziologicheskii zhurnal SSSR, v. 52, no. 1, 1966, 22-28

TOPIC TAGS: alkali metal, rare earth, ion concentration, biochemistry, animal physiology, neurology, neuron

ABSTRACT: The effect of alkaline and alkaline-earth metals and their salts on the permeability of a denuded nerve of a frog was studied. The denuded nerve in most of the experiments was placed into a plexiglass five mm wide, and two cm long. Two electrodes (silver chloride spirals) covered with a layer of agar dissolved in hot Ringer's solution were also placed into the vessel. One of the electrodes was used for the electric polarization of the nerve; the other for the derivation of potentials from the nerve in the vessel. The experiments began with the recording of the physical electrotonus induced by various intensities of the polarizing current in the nerve saturated with Ringer's solution or a physiological solution of NaCl. No difference in the physical electrotonus values could be found when either of the solutions

UDC: 612.819

Card 1/2

L 34737-66

ACC NR: AP6025123

was used, and therefore the ions Na and Cl in concentrations of 0.1 M were accepted as those which indicate the normal permeability of the nerve fibers. The solutions were then replaced by solutions of alkaline elements. It was found that the ion K increases the permeability of the nerve fiber membrane; it also tends to increase permeability for the Na ion; ions Rb and Cs like that of K also increase the permeability of the nerve fiber's membrane. It was also established that in hydrated state rubidium depresses anelectrotonus, and Cs intensifies both - the an - and catelectrotonus; the cations of the alkaline-earth metals all intensify the catelectrotonus, with barium having the strongest effect and magnesium the weakest. All of the cations of the alkaline-earth metals with exception of Mg increase anelectrotonus.

Authors : Vorontsov, E. I.

Title : Quantitative spectral analysis during the excitation of a spectrum with a strong impulse discharge

Periodical : Izv. AN SSSR, Ser. fiz. 18/2, page 262, Mar-Apr 1954

Abstract : Three systems for the generation of strong impulses, necessary for the excitation of a spectrum, are briefly outlined. A study of the excitation sources showed that the phenomenon of spontaneous discharge displacement (wandering) affects the intensity of the spectrum and its reproducibility. The nature of the discharge wandering depends upon the treatment of surfaces of the sample and upon the presence of third components. In order to eliminate this phenomenon it is suggested to glue an insulation disc to the surface of the sample. The disc must be provided with a special aperture for the focusing of the discharge. It was established that impulse localized discharges stabilize the absolute and relative spectral line intensities and also eliminates the effect of third components.

"Basic Elements in the Construction of Circuits for City Electric Power Networks," Dr. Tech Sci, A. A. Glazunov, Cand Tech Sci, I. S. Bessmertnyy, and Engr F. F. Vorontsov, Moscow

"Elektrichestvo" No 12, pp 3-8

Examines modern circuits for low-voltage city power networks, giving eng characteristics and proposing classification and designations. Shows that automatized, duplicate-service, high-voltage network with open-circuit low-voltage network costs 20-25% more in capital and operating expenditures than closed networks. Article is intended to stimulate discussion in connection with revision of "Instructions on Planning City Electric Power Networks". Submitted 19 Jun 52.

Title : An efficient design of low-voltage network in large
cities

Periodical : Elektrichestvo, 8, 33-38, Ag 1955

Abstract : The Chair of Electric Networks and Systems of the
Moscow Power Engineering Institute made a technical
and economic comparative study of various types of
220/127- and 380/220-v secondary mains in large
towns having houses from 5 to 8 and from 8 to 14
stories high. It was found more efficient to use
loop type 220/127-v secondary bank arrangements.
Investments are in practice identical at both vol-
tages but operational charges at 380/220 v increase
by 50 to 60%, while additional outlays for copper

("Tr. Vses. n.-i. in-ta pod'yemnostransp. mashinostr.", 1960, no. 3, 125 - 218)

TEXT: The authors present characteristics of main domestic Al alloys for welded and riveted structures and analyze problems of planning, production technology and economy. The total labor consumption of manufacturing 1 ton Al-structures is by 2.15 times higher, and the cost by 3.25 times higher than corresponding data for steel structures, although for Al structures mainly semi-automatic arc welding and for steel structures manual welding is employed. The ratio of the total cost of an Al crane to that of a steel crane is 1.11. It is noted that the planning of Al cranes should be made by taking into account reduced Al costs. The authors present recommendations as to the selection of equipment and conditions of arc-cutting of Al and its alloys. The selection of conditions, preparations

TITLE: Determination of the Principal Free Vibrational Frequencies of Beam Carrying Concentrated Masses, Utilizing the Method of Successive Approximations. (Opredeleniye pervykh chastot svobodnykh kolebaniy balok, nesushchikh sosredotochenyye massy, metodom posledovatel'nykh priblizheniy)

PERIODICAL: Tr. Novocherkassk. politekhn. in-ta, 1956, Nr. 33/47, pp 133-147

ABSTRACT: Investigated are the free vibrations of beams having a distributed mass of their own and carrying concentrated masses. Systems of equations, from which the free vibrational frequency is obtained by the method of determinants, are transformed into equations for the determination of the critical loadings of compressed beams having rigid or elastic supports at intervals, and also of beams lying on an elastic base.

A method of successive approximations is proposed for the determination of the free vibrational frequencies.

TITLE: Fermentation as a method of purifying the antigen in producing purified concentrated <u>botulinum anatoxins</u> by new technology	
SOURCE: Moscow. Nauchno-issledovatel'skiy institut vaktsin i syvorotok. Vaktsiny i syvorotki; materialy po proizvodstvu, no. 1, 1963, 21-26 6.44.5	
TOPIC TAGS: clostridium, botulism, antigen, chemical purity, solution concentration, enzyme, fermentation, protein	
ABSTRACT: Cl. botulinum toxin types A and B have been successfully purified and concentrated by an "autofermentation" process. During the growth of Cl. botulinum cultures types A and B, large amounts of proteinase are liberated into the surrounding medium and the amount of protein nitrogen is reduced, thereby increasing the specific activity of the culture fluid. However, the problem of purification is considerably more difficult in the case of Cl. botulinum culture types D and E which do not liberate appreciable amounts of proteinase into the surrounding medium. Fermentation methods using trypsin or Cl.

CONTENTS: The book deals with trends in the development of basic problems of interconnectability. Existing measuring equipment in the tests and other services is discussed. Some factors and utilization of them in the use of interconnectivity and automatic control systems are outlined. Experiments are carried out to establish and equipment for feedback and mechanical control and control of the geometry and position of parts. By personalities as well as methods. References accompany several of the articles.
